Domestic Agencies		7.01	
Agencies Abroad		7.03 - 7.04	

Features:

- ☒ single-phase controlled soft starter
- ☒ all devices for pole-changing motors
- ☒ dual-voltage, for 400V and 230V networks
- ☒ terminal arrangement suitable for switchgear connection
- ☒ for snap-mounting on 35mm standard rail
- ☒ integrated bypass relay
- ☒ no mains neutral conductor (N) required
- ☒ special voltages up to 640V
- ☒ also for single-phase applications
- ☒ degree of protection IP 20

Soft Starters

SAS 3 ... 11

Function:

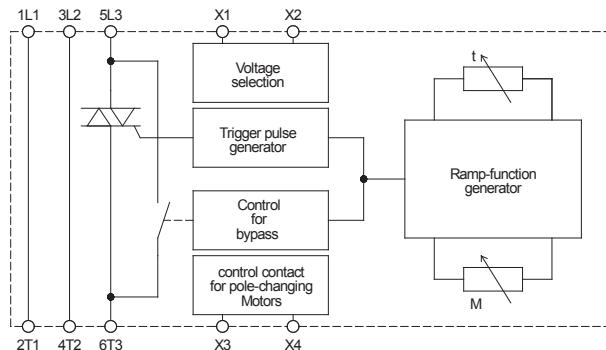

- ☒ soft start
- ☒ 2 separately adjustable parameters
starting torque, starting time
- ☒ control contact for pole-changing motors

Typical Applications:

- packaging machinery
- sliding doors
- belt drives
- conveying machinery
- door drives of passenger and goods lifts
- limitation of starting current for transformers

Upon request:

- ☒ potential-free input
control voltage 10 ... 30VDC
- ☒ SAS 3 up to SAS 11:
suitable standard up to 480V
special voltages 500V up to 640V
(all types in 100mm-housing)

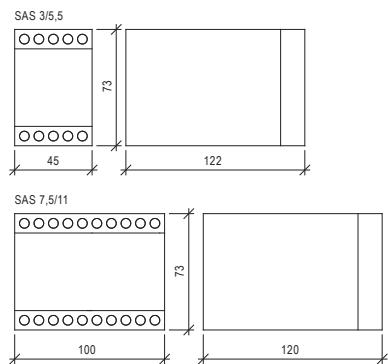

Typical designation	SAS 3	SAS 5,5	SAS 7,5	SAS 11
motor rating at 230V	1,5kW	3kW	4kW	5,5kW
motor rating at 400V	3kW	5,5kW	7,5kW	11kW
mains / motor voltage X1-X2 jumpered according to DIN EN 50160 (IEC 38)	160 ... 240V ±10 %			
mains / motor voltage X1-X2 not jumpered according to DIN EN 50160 (IEC 38)	380 ... 480V ±10 %			
order number	20700.40003	20700.40005	20700.40007	20700.40011

Technical data	SAS 3	SAS 5,5	SAS 7,5	SAS 11
mains / motor voltage X1-X2 jumpered according to DIN EN 50160 (IEC 38)		160 ... 240V ± 10%		
mains / motor voltage X1-X2 not jumpered according to DIN EN 50160 (IEC 38)		380 ... 480V ± 10%		
rated device current	6,5A	12A	15A	25A
mains frequency		50/60Hz		
rated power at 230V	1,5kW	3kW	4kW	5,5kW
rated power at 400V	3kW	5,5kW	7,5kW	11kW
min. motor current		10% of device rating		
starting torque		0 ... 50%		
starting time		0,5 ... 5s		
restart time		200ms		
max. switching cycle at 3xle and 5s t _{an}	240/h	200/h	120/h	70/h
max. cross-sectional area		2,5mm ²		
ambient / storage temperature		0°C ... 45°C / -25°C ... 75°C		
weight / kg	0,3			0,5

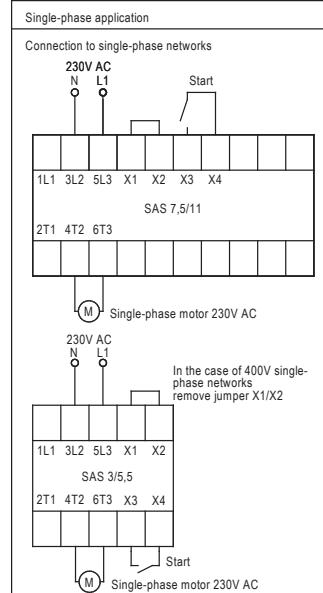

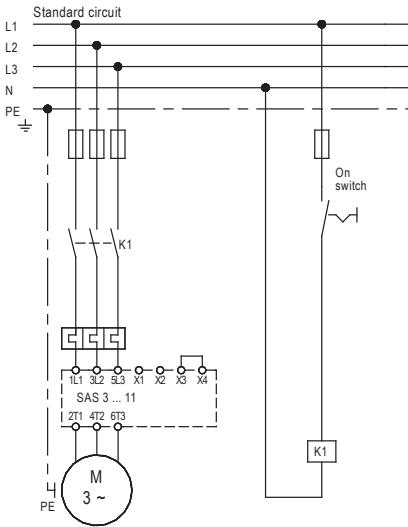

Note:

Please pay attention and consider for the operation of IE3 motors while dimensioning of softstarters and dc brakes the resulting higher starting and braking currents.

For the use of IE3 motors we highly recommend to dimension and design the needed softstarters and braking devices one size higher.

Dimensions:

All dimensions indicated in mm

Connection Diagram:

Features:

- ☒ two-phase controlled soft starter
- ☒ controlled by microcontroller
- ☒ optimized soft start
- ☒ current and torque reduction during acceleration
- ☒ easy mounting, for snap-mounting on 35mm standard rail
- ☒ integrated bypass relay
- ☒ parameterization by means of three potentiometers
- ☒ no additional control voltage required
- ☒ no mains neutral conductor (N) required
- ☒ economically priced substitute for star-delta starters
- ☒ compact design, 45mm
- ☒ degree of protection IP20

Soft Starters
VS II ...-3,5...16

  US LISTED

Function:

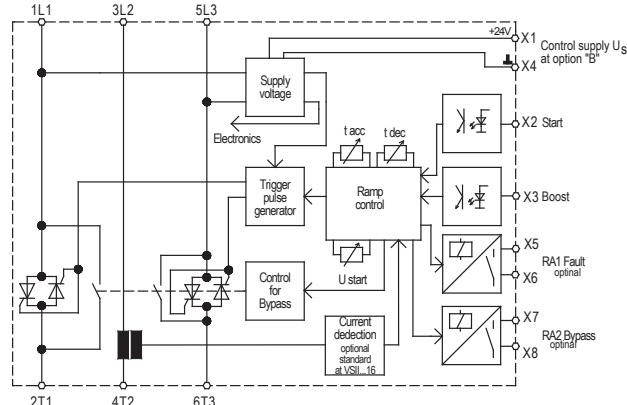

- ☒ soft acceleration and deceleration
- ☒ potential-free control input for soft acceleration and deceleration
- ☒ 3 separately adjustable parameters
accel. time, start voltage, decel. time
- ☒ boost-start selectable
- ☒ potential-free relay output for operating state
- unit bypassed – and failure (optional)

Typical Applications:

door and gate drives
pumps, ventilators, fans
conveying machines, packaging machines
transport systems, assembly lines
machine applications

Options: (upon request)

- ☒ special voltages 230V and 480V
- ☒ wide voltage range 200-480V with external control supply voltage U_s 24VDC (B)
- ☒ signalling contact (I)
bypass and failure
- ☒ motor-PTC (I)
- ☒ current control (200...500% $x I_N$) (I)
- ☒ heat sink temperature monitoring (I)
- ☒ $\sqrt{3}$ – connection (cost saving via smaller rating)
- ☒ signalling contact (M)
(beginning of acceleration until end of deceleration)

Soft Starter with reversing function VersiStart II 9 PS

1.05

Features:

- ☒ two-phase controlled soft starter with reversing function
- ☒ controlled by microcontroller
- ☒ currentless reversing with relay, soft start with thyristors
- ☒ overload protection
- ☒ 4 potentiometers to adjust starting torque, stopping torque, acceleration /deceleration time and overcurrent limit
- ☒ electrically isolated 24V inputs for clockwise / anti clockwise rotation
- ☒ reset via device panel or external reset switch
- ☒ 4 LEDs as status indicators
- ☒ current and torque reduction during start-up
- ☒ integrated bypass relay
- ☒ integrated mains contactor
- ☒ ultra-slim compact design, width: 22,5mm
- ☒ degree of protection IP20

Soft Starter with
reversing function
VersiStart II 9 PS

CE

Function:

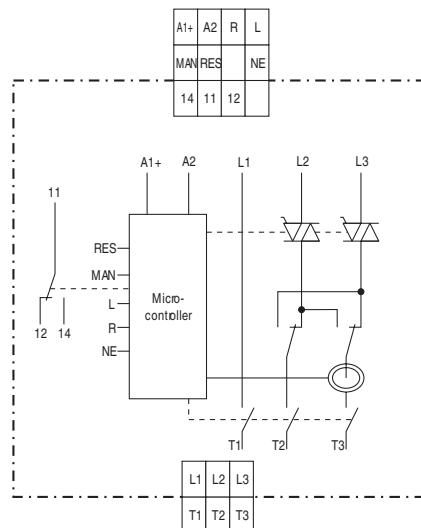

- ☒ soft start and soft stop
- ☒ reversing function
- ☒ current monitoring
- ☒ blocking protection
- ☒ potential-free relay outputs for operational status
- ☒ signalling output programmable acc. to customer requirements

Typical Applications:

reversing drive for door and gate control, bridge drives and hoisting gear with blocking protection
conveying systems with blocking protection
actuators in process technology with blocking protection
points drives

Option: (upon request)

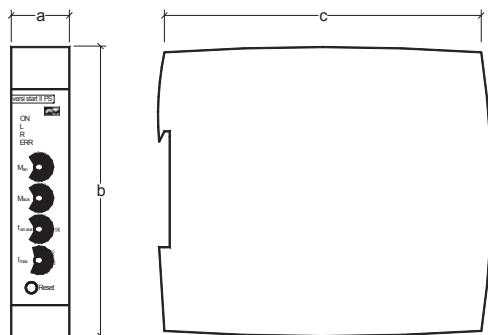

- ☒ special acceleration/deceleration time 0 ... 1s
- ☒ motor protection variant

Typical designation	VersiStart II 9 PS
rated device current	9A
mains / motor voltage acc. to DIN EN 50160 (IEC 38)	200-480V ±10% 50/60Hz
motor rating at 400V mains voltage	4kW
order number	2S610.40009

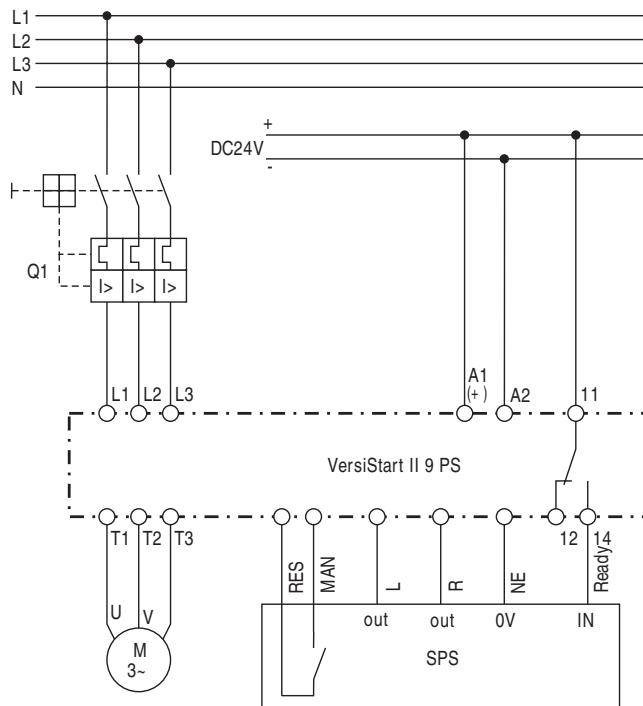

Please observe supplementary sheet with dimensioning rules!

Technical data	VersiStart II 9 PS
mains / motor voltage acc. to DIN EN 50160 (IEC 38)	200-480V $\pm 10\%$ 50/60Hz

Soft Starters VersiStart p II 250 ... 580

1.13

Features:

- ☒ two-phase controlled digital soft starter (11-800kW)
- ☒ integrated bypass
- ☒ current and torque reduction during acceleration
- ☒ USB port
- ☒ comprehensive and customizable motor operating performance
- ☒ display graphical LCD – real time graphs of motor operating performance
- ☒ degree of protection IP20 up to 135A
- ☒ motor PTC connection

Soft Starters
VS p II ...-250 ... 580

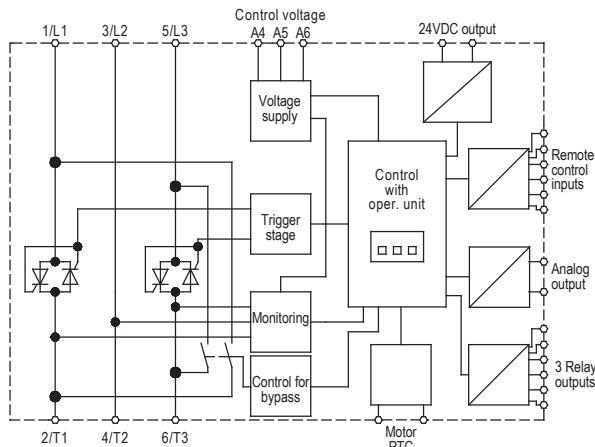

Typical Applications:

Function:

- ☒ remote control inputs (2x fixed, 2x programmable)
 - ☒ relay outputs (3x programmable)
 - ☒ 24VDC output
 - ☒ analog output
 - ☒ divers soft start/stop control types
 - ☒ units with 600V upon request
- pumps, ventilators
 - compressors
 - mills, crushers, presses
 - conveying systems
 - drives with high-inertia starting
 - machines with gear units, belt or chain drives

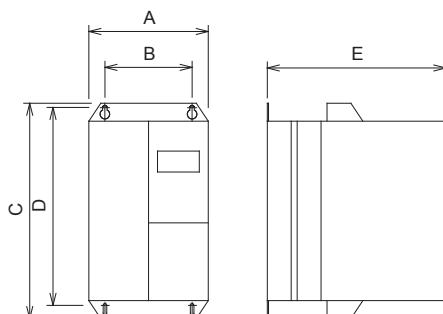

Accessories:

- ☒ Remote Keypad & Cable (29000.2S801)
- ☒ DeviceNet Interface (29000.2S802)
- ☒ Ethernet IP Interface (29000.2S803)
- ☒ ModBus RTU Interface (29000.2S804)
- ☒ ModBus TCP Interface (29000.2S805)
- ☒ Profibus Interface (29000.2S806)
- ☒ Profinet Interface (29000.2S807)
- ☒ Remote Keypad Card (29000.2S808)
- ☒ Remote Keypad, Card & Cable (29000.2S809)
- ☒ SmartCard Pump Application (29000.2S810)
- ☒ Finger protection (from 184A up to 580A, 29000.2S811)

		21, 22	Analog output

Features:

- ☒ three-phase controlled soft starter
- ☒ controlled by microcontroller
- ☒ optimized soft start and current control
- ☒ connection in the motor delta winding (cost saving via smaller rating)
- ☒ current and torque reduction during acceleration
- ☒ easy mounting, for snap-mounting on 35 mm standard rail
- ☒ integrated bypass relay
- ☒ parameterization by means of potentiometers
- ☒ no mains neutral conductor (N) required
- ☒ economically priced substitute for star-delta starters
- ☒ spring-loaded terminals
- ☒ heat sink temperatur monitoring
- ☒ compact design, 45mm up to 25A and 52,5mm at 45A
- ☒ degree of protection IP20
- ☒ motor protection
- ☒ thermal device protection

Soft Starters
VS III ...-9...45

Function:

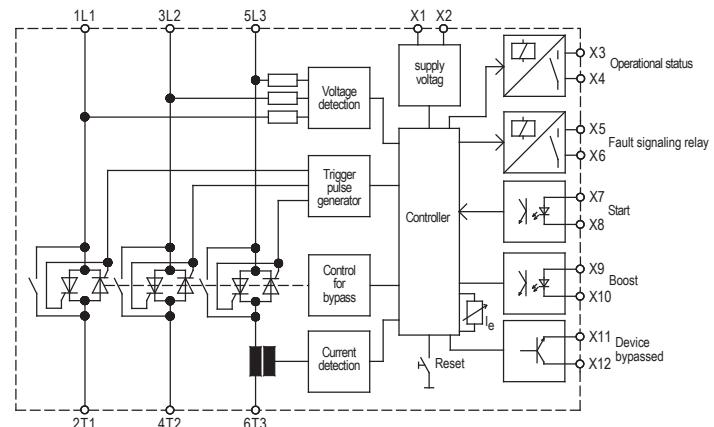

- ☒ soft acceleration and deceleration
- ☒ potential-free control input for soft acceleration and deceleration
- ☒ separately adjustable parameters accel. time, start voltage, decel. time, current limiting, rated device current and tripping class
- ☒ boost-start selectable
- ☒ potential-free relay output for operating state
- ☒ transistor output – unit bypassed

Options (upon request)

- ☒ special voltages 230V and 480V
- ☒ wide voltage range 200-480V with external control supply voltage U_s 230VAC (B)

Typical Applications:

door and gate drives
pumps, ventilators, fans
conveying systems, packaging machines
transport systems, assembly lines, machine application

Note:

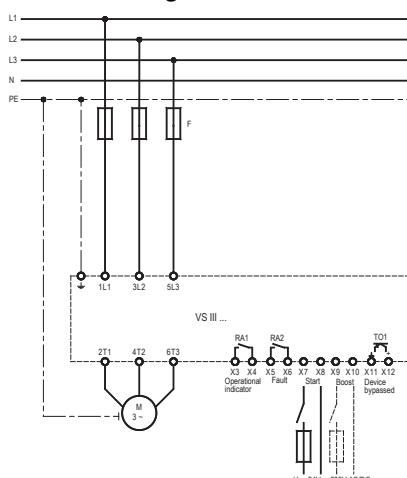

Please pay attention and consider for the operation of IE3 motors while dimensioning of softstarters and dc brakes the resulting higher starting and braking currents.

For the use of IE3 motors we highly recommend to dimension and design the needed softstarters and braking devices one size higher.

Configuration Instructions

The two following diagrams for an 11kW-drive operated at nominal load show the waveforms of electrical and mechanical quantities of the drive during the ramp-up phase, both with and without soft starter:

Ramp-up of the three-phase asynchronous motor directly connected to the mains (at nominal load)

Ramp-up of a three-phase asynchronous motor with soft starter (at nominal load)

Both groups of curves show the complete acceleration and deceleration phase.

In this connection, especially the waveform of the current during ramp-up with a soft starter is of interest. Depending on the adjusted starting voltage (boost), the current increases more or less steeply until nominal speed is reached. For the following load diagrams (thermal load), the mean value of that current is to be used which is formed by the current flowing at the starting point and the current flowing when nominal speed is reached (see example).

The following diagrams show how the maximum starting frequency (in starts per hour) depends on the ramp-up time and the mean starting current flowing during ramp-up.

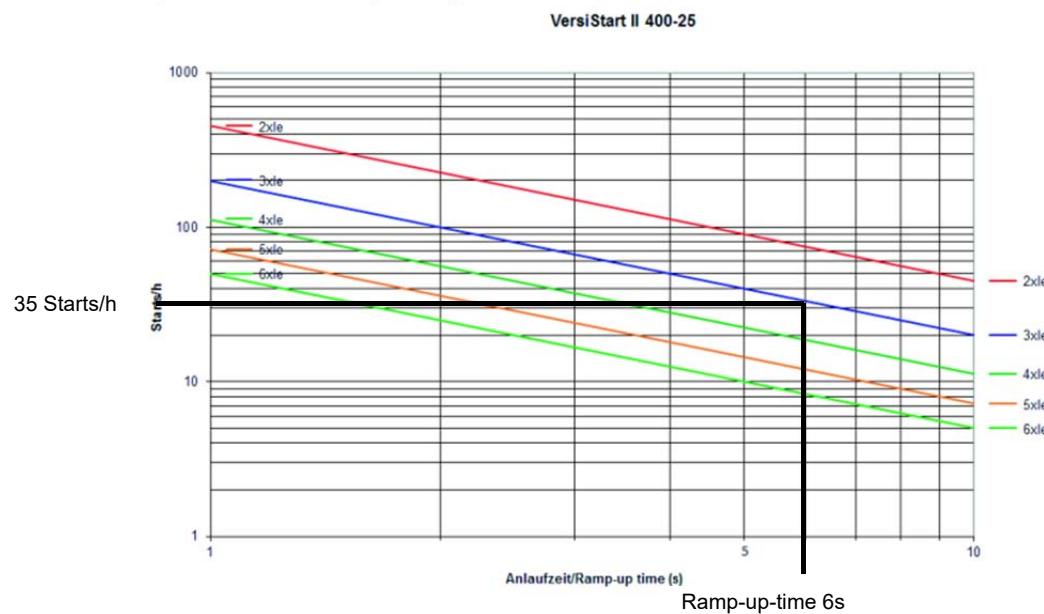

The curves represent the thermal ratio of the heat generated in the power semiconductors and the possible dissipation of heat by the integrated heat sinks, i.e., a high starting frequency in combination with a large mean starting current causes intense heating by the power semiconductors. If, in addition, a long ramp-up time is required for the starting operation, the number of starts possible within a certain unit of time reduces accordingly.

The following example is to explain how to select a soft starter:

Assumption:	motor shaft power:	11kW
	nominal/rated motor current:	21,7A
	max. ramp-up time:	6s
	mean starting current to be expected:	65A (no high-inertia starting)
	max. starting frequency:	50 starts/h

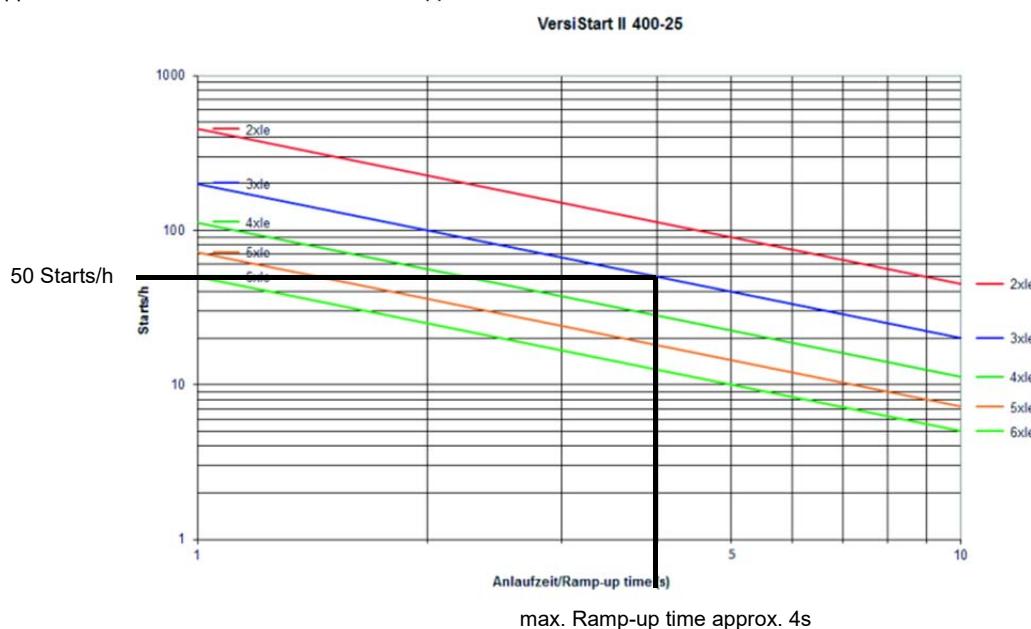

In compliance with the power rating of the motor, a **VersiStart II 400-25** soft starter is selected (acc. to the data sheet it is suitable for 11kW motors, $I_e = 25A$).

However, when checking the number of starts per hour possible with this device under these conditions, it turns out that this device is not suitable:

When dividing the starting current of 65A to be expected by the nominal current of 25A of the soft starter **VersiStart II 400-25**, this gives approx. $3 \times I_e$ ($65A/25A$) of the soft starter. Consequently, a maximum starting frequency of 35 starts per hour is permissible for this device, i.e., in this case **VersiStart II 400-25** would be overloaded.

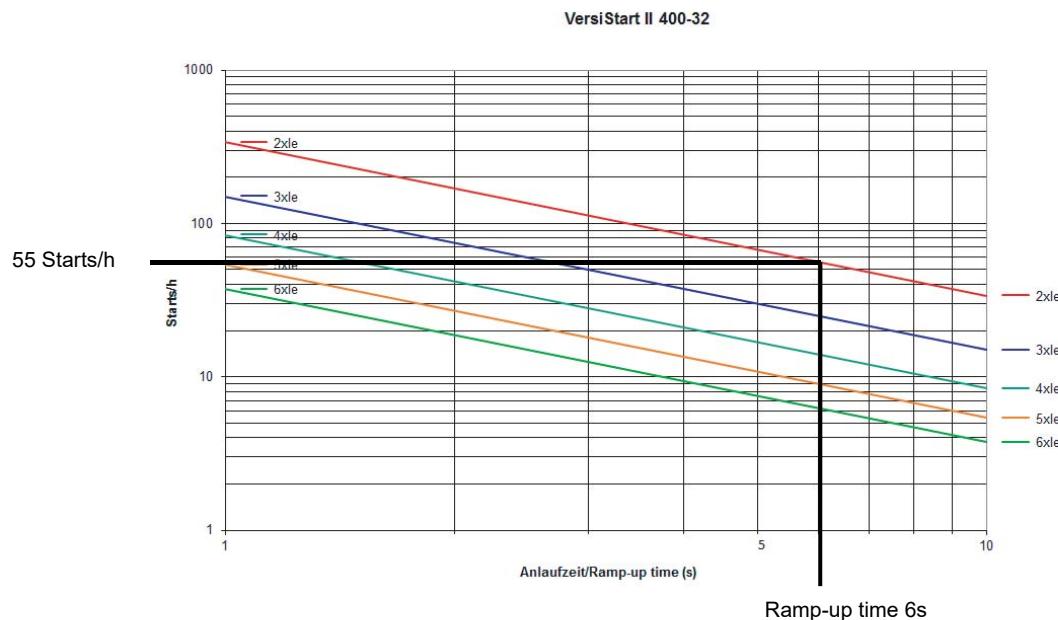

This is only possible by reducing the ramp-up time. As demonstrated by the two below diagrams, the ramp-up time maximally possible for the application of a **VersiStart II 400-25** would be approx. 4s.

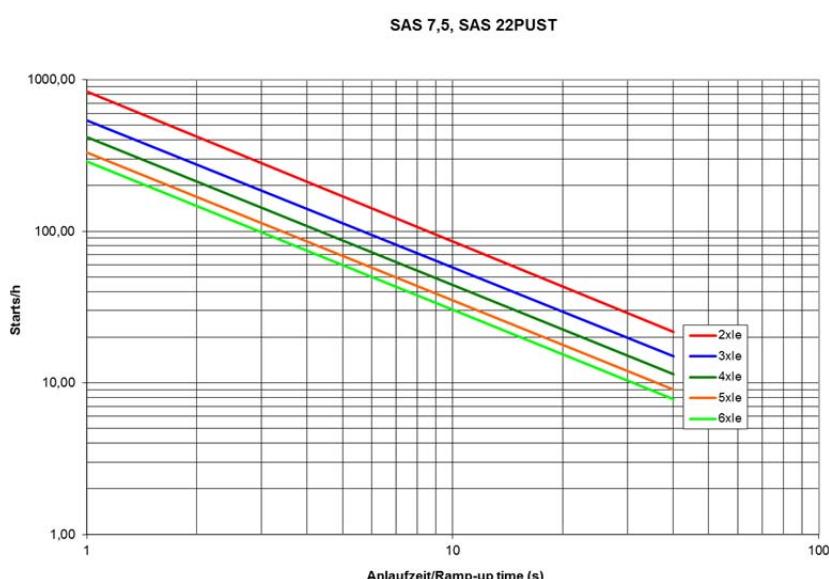

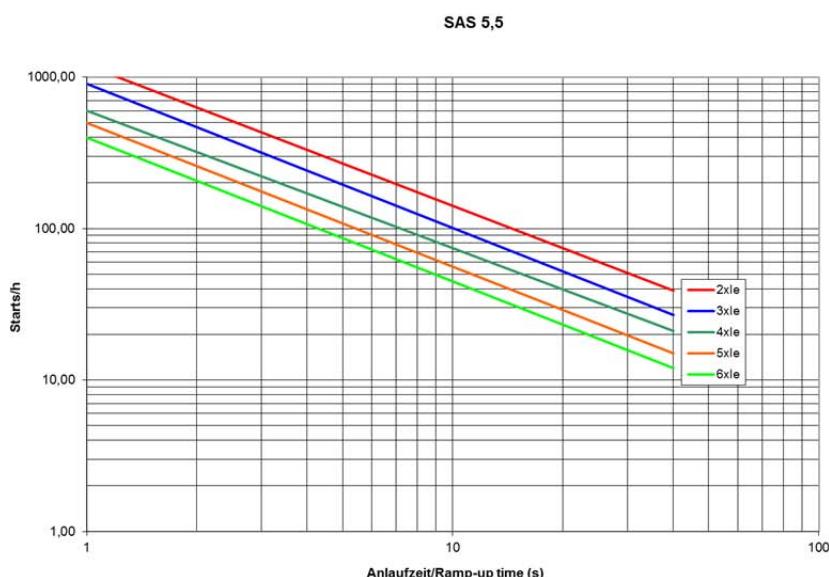

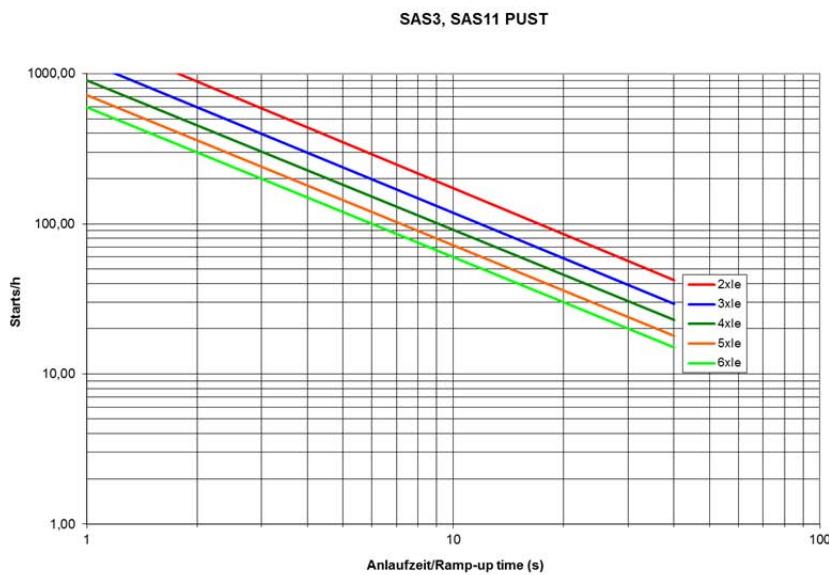

If it is due to technological reasons not possible to go below the specified ramp-up time of 6s, a device that complies with the requested parameters has to be used.

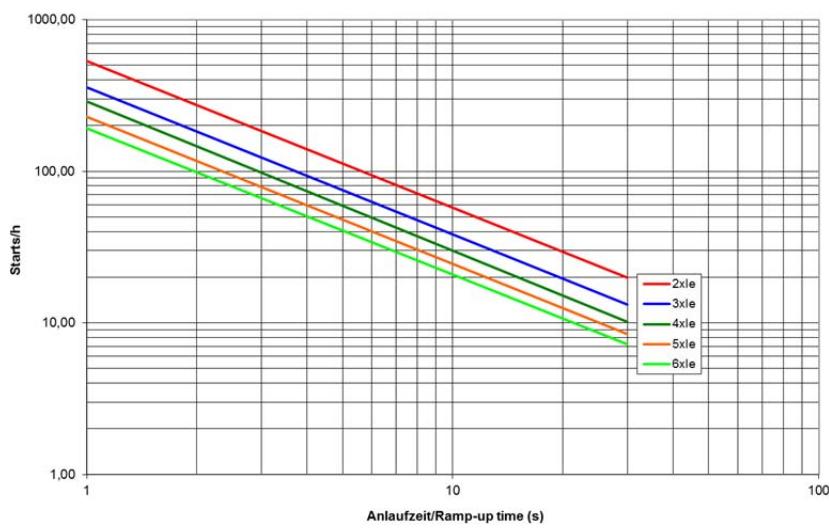

When looking at the characteristic curves, it becomes clear that, for this case of application, a **VersiStart II 400-32** is suitable. With a twofold nominal current of the soft starter, i.e., $2 \times I_e$ (65A/32A), and a ramp-up time of 6s, this device has a starting frequency of approx. 55 starts/h.

Since only 50 starts/h are required, this device is optimally designed to withstand the most unfavorable thermal loading.

Dimensioning of pre-fuses:

Basically, two types of fuse protection are available for the user:

1. Fusing according to allocation type „1“ DIN EN 60947-4-2.
After a short circuit the soft starter is allowed to be inoperative and repair work is possible.
2. Fusing according to allocation type „2“ DIN EN 60947-4-2.
After a short circuit the device must be suitable for further use. However, there is the danger that the contacts of the by-pass relays (-contactors) weld. Therefore, if possible, these contacts are to be checked prior to reconnecting the device to the supply. If this check cannot be carried out by the user, the device has to be returned to the producer in order to have it checked.

The following dimensioning information refers to the below operating conditions:

- Use of standard asynchronous motors
- Standard ramp-up and/or deceleration times

Fusing according to allocation type „1“:

As pre-fuses, we recommend to use fuses of utilization category gG or aM.

The fuse values are to be determined by taking the conductor cross-sectional area of the wiring into account. The wiring cross-sectional area is to be determined in dependence on the rated motor current, the maximally occurring starting current (normally up to the 5-fold rated device current) and the starting frequency. Table 1 shows the values for numerous applications, i.e., with a 3-fold nominal/rated current as mean starting current and a maximum ramp-up time of 10s. In the case of parameter values exceeding these values, it may be necessary to adapt the fuse value accordingly.

Note: Wiring cross-sectional area according to DIN VDE 0100-430, DIN EN 57100-430.

Fusing according to allocation type „2“:

The power semiconductors are to be protected by fuses of the utilization category gR (semiconductor fuses, high-speed fuses). However, since these fuses do not ensure line protection, it is necessary to use additionally line protection fuses (utiliz. category gL).

To protect the semiconductors it is necessary to select gR-fuses featuring cutoff I^2t -values which are approx. 10-15% below the I^2t -value of the power semiconductor (see technical data). In this connection, the current-value of the selected fuse should not be smaller than the starting current to be expected.

PETER electronic does not prescribe the use of semiconductor protection fuses. However, for some UL- or CSA-listed devices there are exceptions which are indicated in the relevant commissioning instructions.

Notes

- On the basis of the I^2t -value of the power semiconductors, the ramp-up time and possibly the max. starting current, the fuse supplier is able to select a suitable type. Due to the great variety of producers, sizes and types. PETER electronic does not recommend any particular fuses.
- If the value of the fuse or the cutoff- I^2t -value is selected too small, it may happen that the semiconductor fuse reacts during the starting phase or during deceleration.
- In the case of special devices having increased ramp-up or deceleration times, the recommended fuse value may have to be adapted.

Deatues:

- ☒ simple motor control with only a few elements
- ☒ motor contactor and DC-brake in a single device
- ☒ suitable for all asynchronous motors
- ☒ controlled by microcontroller
- ☒ easy mounting, also for retrofitting into existing plants
- ☒ motor contactor with contact gap $\geq 3\text{mm}$, utilization category AC-3
- ☒ operator's controls physically separated from load (24V extra-low voltage)
- ☒ connection of several „STOP“ buttons possible
- ☒ for snap-mounting onto 35mm top-hat rail
- ☒ degree of protection IP 20
- ☒ meets trade assoc. requirements for category 2 acc. to GS-HO-01
- ☒ intermateable with BRMS

Combined Motor Start
and Braking Devices
VBMS ...

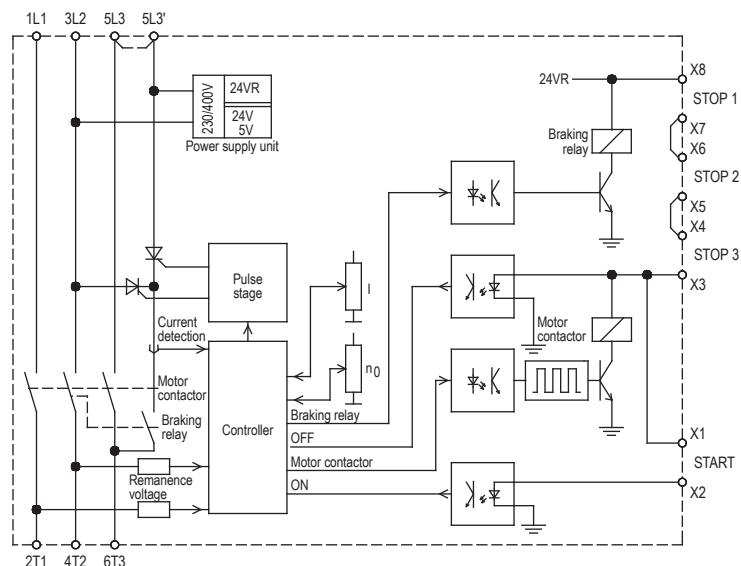

Function:

- ☒ direct online start via motor contactor
- ☒ DC braking
- ☒ control via buttons or via switch
- ☒ braking current infinitely adjustable
- ☒ standstill threshold adjustable
- ☒ braking current cutoff after motor standstill
- ☒ monitoring of braking frequency (overload protection)
- ☒ monitoring of exceeded braking time of 10s
- ☒ start interlock in case of safety relevant errors

Typical Applications:

sawing machines
centrifuges
vibrators

Dimensioning VC II Safe

Dimensioning of pre-fuses:

The pre-fuses can be dimensioned according to the following instructions:

Fusing according to allocation type „1“, DIN EN 60947-4-2. After a short circuit, the device is allowed to be inoperative. After an overload or a short-circuit on the output-side, repair work is possible.

The following dimensioning information refers to the operating conditions below:

- Use of asynchronous motors IE1, IE2 and IE3 (IE4 in preparation)
- Start-up and/or braking times in accordance with the datasheet
- Switching frequency is not higher than stated in the datasheet

Fusing according to allocation type „1“:

As pre-fuses, we recommend using fuses in the operating class aM.

If these fuses are also used as cable protection, the cable cross-section must be coordinated accordingly!

Short-circuit protection according to EN 60947-4-2

Device rated current (technical data)	Device type	Fuse rating with allocation type 1	Fuse type (recommendation)
12A	VC II S ...-12	16A	690V NHO aM
22A	VC II S ...-22	25A	690V NHO aM
37A	VC II S ...-37	40A	690V NHO aM
50A	VC II S ...-50	63A	690V NHO aM
60A	VC II S ...-60	80A	690V NHO aM

Short-circuit protection according to UL 508 (Class RK5 Fuse)

Device rated current (technical. data)	Device type	Fuse rating	Fuse
12A	VC II S 575-12	20A	600V AC
22A	VC II S 575-22	40A	600V AC
37A	VC II S 575-37	50A	600V AC
50A	VC II S 575-50	60A	600V AC
60A	VC II S 575-60	80A	600V AC

Fusing according to allocation type „2“:

For the protection of the power semiconductors, semi-conductor fuses of the operating class aR or gR are necessary. However, since these fuses do not guarantee any line protection, circuit breakers (operating class gG), must be used in addition.

As fuses for the semi-conductor protection, fuses must be selected whose switch-off is suitable for I^2t -value approx. 10-15% below the I^2t value boundary of the power semiconductor (see technical data). The current value of the selected fuse in this case should not be less than the inrush current to be expected.

Notes

- The employment of semi-conductor fuses is not prescribed by PETER electronic. There are exceptions in case of some UL or CSA authorised devices. In this case, this is referred to in the start-up instruction.
- With the specifications on the I^2t value of the power semiconductors, the start-up time and possibly the max. inrush current, the fuse supplier is able to select a suitable type. Because of the large number of manufacturers, construction sizes and types, a fuse recommendation by PETER electronic is not appropriate.
- If the fuse rating or the switch-off I^2t value is selected too small, the semiconductor protection fuse can release during the start phase or the soft rundown.

Motor protection switch

IEC / Europe 400V

Motor power	Siemens	EATON
5,5kW	3RV2021_17-22A	PKE 16-65A
11kW	3RV1031_28-40A	PKE 16-65A

30kW	3RV1041_57-75A	PKE 16-65A

Dimensioning VBMS

Dimensioning of pre-fuses:

Basically, two types of fuse protection are available for the user:

1. Fusing according to allocation type „1“, DIN EN 60947-4-2.
After a short circuit, the braking device is allowed to be inoperative.
2. Fusing according to allocation type „2“, DIN EN 60947-4-2.
After a short circuit, the braking device must be suitable for further use. However, there is the danger that the contacts of the braking relay (braking conductor) weld. Therefore, if possible, these contacts are to be checked prior to applying again mains voltage to the device. If this check cannot be carried out by the user, the device has to be returned to the producer in order to have it checked.

The following dimensioning information refers to the below operating conditions:

- Use of standard asynchronous motors
- Braking current not exceeding $2.5 \times I_{NOM}$ of the motor
- Cyclic duration factor (c.d.f.) not exceeding the value indicated in the datasheet

Fusing according to allocation type „1“:

As pre-fuses, we recommend to use line protection fuses (utilization category gL) or automatic circuit breakers with tripping characteristics B, C, D or K.

Taking into account the maximum braking currents that occur (normally the rated device current), we recommend fuses according to table 2, column 3.

Note:

- *Wiring cross-sectional area according to DIN VDE 0100-430, DIN EN 57100-430.*

Fusing according to allocation type „2“:

The power semiconductors are to be protected by fuses of the utilization category gR (semiconductor fuses, high-speed fuses). However, since these fuses do not ensure line protection, it is necessary to use additionally line protection fuses (utilization category gL).

As for the dimensioning of the line protection fuse (gL), please refer to table 2, column 3.

To protect the semiconductors it is necessary to select gR-fuses featuring cutoff- I^2t -values of the ranges indicated in table 2, column 4. In this connection, the fuse rating of the selected fuse should not be smaller than the braking current to be expected (rated device current).

Notes

- *On the basis of the recommended Pt -value, braking current, and possibly the c.d.f., the fuse supplier is able to select a suitable type. Due to the great variety of producers, sizes, and types, PETER electronic does not recommend any particular fuses.*
- *If the fuse or cutoff Pt -value is selected too small, it may happen that the semiconductor fuse reacts during braking.*

Table 2

Column 1	Column 2	Column 3	Column 4
max. Braking current	Device Typ	Fuse value in the case of allocation type 1	Recommended range for cutoff- I^2t -value of semiconductor protection fuses in the case of allocation type „2“

Braking Devices VersiBrake 230/400-6/25/30L (LP)

3.01

Features:

- ☒ DC braking with one-way rectification
- ☒ suitable for all asynchronous motors and for mono phase motors
- ☒ controlled by microcontroller
- ☒ easy mounting, also for retrofitting into existing plants
- ☒ wear-resistant and maintenance-free
- ☒ integrated braking contactor
- ☒ printed circuit-board version with fault signaling contact
- ☒ for snap-on mounting onto 35mm DIN rail
- ☒ degree of protection: case version IP 20,
printed circuit-board version IP 00
- ☒ meets trade assoc. requirements for PL = b,
acc. to DIN EN ISO 13849-1

Braking Devices
VB 230-6/25/30L (LP)
VB 400-6/25/30L (LP)

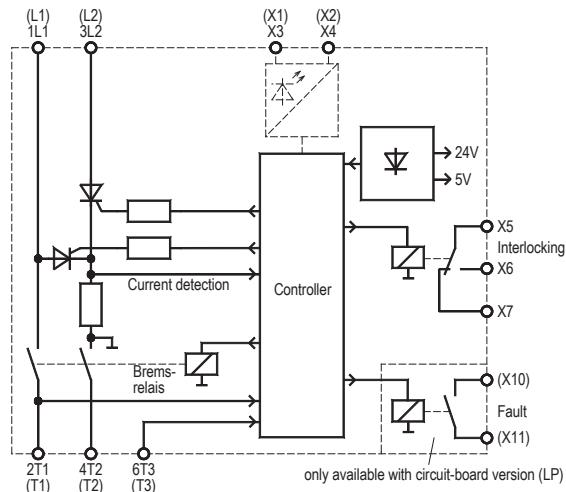

Function:

- ☒ start braking via detection of motor voltage and via motor contactor (double safety)
- ☒ overload protection
- ☒ braking current cutoff after motor standstill
- ☒ braking current control
- ☒ automatic remanence time optimization
- ☒ braking current infinitely adjustable 10-100%
- ☒ potential-free output for motor contactor interlocking during braking;
also usable to energize the star contactor during braking
- ☒ standstill threshold adjustable,
individual adaptable to different motor types

Typical Applications:

sawing machines
centrifuges
wood working machines
textile machines
conveying systems

Note:

Please pay attention and consider for the operation of IE3 motors while dimensioning of softstarters and dc brakes the resulting higher starting and braking currents.

For the use of IE3 motors we highly recommend to dimension and design the needed softstarters and braking devices one size higher.

Dimensions:

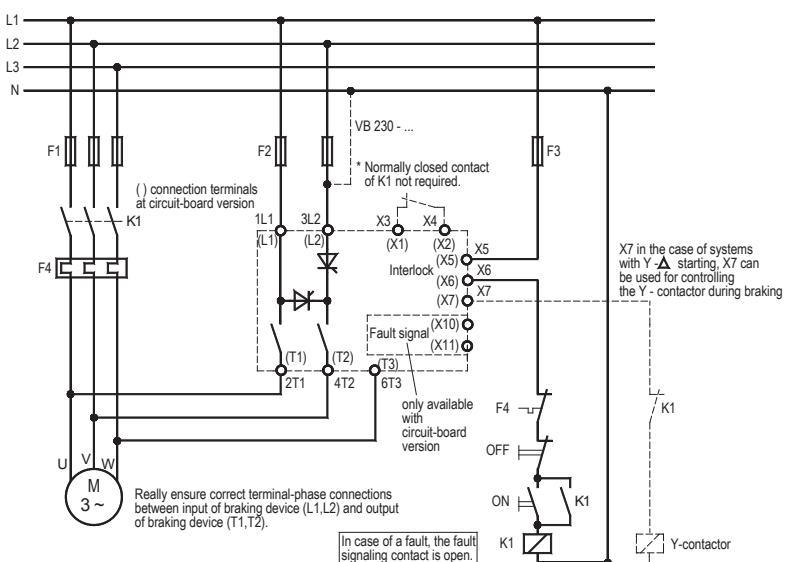

case version (L)

printed circuit-board version (LP)

Alle dimensions in mm

Connection Diagram:

Features:

- ☒ DC braking with one-way rectification
- ☒ suitable for all asynchronous motors and for mono phase motors
- ☒ controlled by microcontroller
- ☒ easy mounting, also for retrofitting into existing plants
- ☒ wear-resistant and maintenance-free
- ☒ integrated braking contactor
- ☒ for snap-on mounting onto 35mm DIN rail
- ☒ degree of protection IP 20
- ☒ successor for braking devices type BR und BR-L

(photo similar)

Braking devices
VB 230-6/25/30LT
VB 400-6/25/30LT

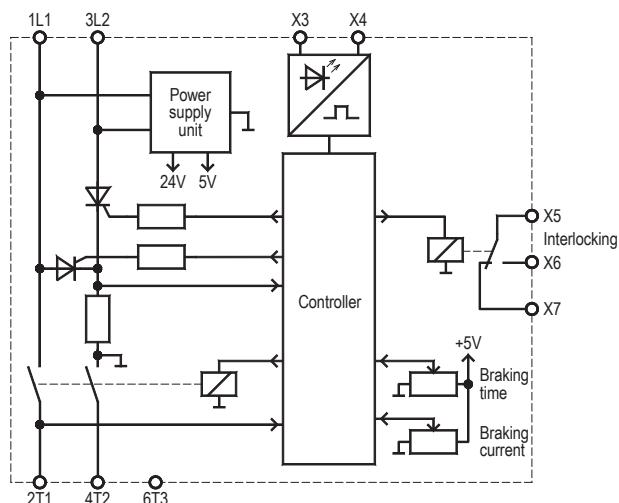

Function:

- ☒ direct online start via motor contactor
- ☒ overload protection
- ☒ braking current control
- ☒ automatic remanence time optimization
- ☒ braking current infinitely adjustable 10-100%
- ☒ braking interrupt is possible
- ☒ restart 1,2s after braking interrupt
- ☒ braking time adjustable
- ☒ potential-free output for motor contactor
Interlocking during braking;
also usable to energize the star contactor
during braking

Typical Applications:

sawing machines
centrifuges
wood working machines
textile machines
conveying systems

EMC
The limit values for emitted interference according to the applicable device standards do not rule out the possibility that receivers and susceptible electronic devices within a radius of 10m are subjected to interference. If such interference, which is definitely attributable to the operation of the braking devices "VB", occurs, the emitted interference can be reduced by taking appropriate measures.
Such measures are, e.g.:
To connect reactors (3mH) or a suitable mains filter in series before the braking device, or to connect X-capacitors (0,15μF) in parallel to the supply voltage terminals.

Braking Devices VersiBrake 25A

3.05

Features:

- ☒ DC Braking with one-way rectification
- ☒ controlled bei microcontroller
- ☒ suitable for all asynchronous motors
- ☒ easy mounting, also for retrofitting into existing plants
- ☒ wear-resistant and maintenance-free
- ☒ special voltages up tp 575V (UL: bis 480V) with Option „B“
- ☒ for snap-mounting onto 35mm top-hat-rail
- ☒ degree of protection IP 20

Braking Devices
VB 230/400-25

Function:

- ☒ control via motor contactor
- ☒ standstill detection
- ☒ braking current limited to rated device current
- ☒ remanence time optimization
- ☒ braking current infinitely adjustable
- ☒ potential-free output for motor contactor interlocking during braking
- ☒ potential-free output for fault signalling relay

Options: (upon request)

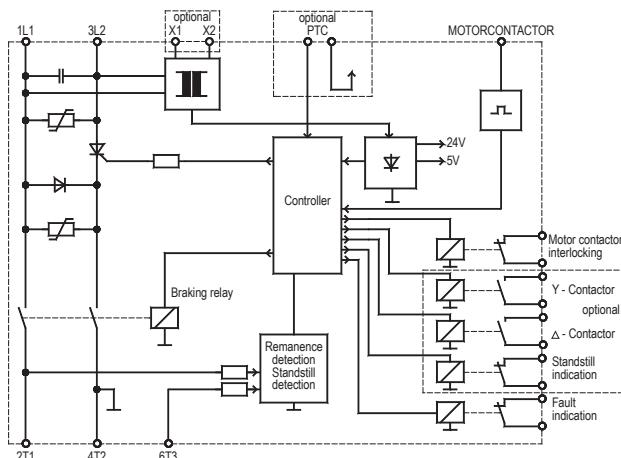

- ☒ star-delta starting control (D)
- ☒ motor temperature monitoring (P)
- ☒ standstill sognalling relay (S)
- ☒ wide-voltage-range 200...575V (B)
control voltage of 24VAC or 230VAC is necessary
(please note on order)

Upon Request:

- ☒ printed circuit-board version

Typical Applications:

sawing machines
centrifuges
wood working machines
textile machines
conveying systems

Dimensioning Rules for Braking Devices

3.11

All data sheets and commissioning instructions are available on our homepage at:
www.peter-electronic.com

Configuration Instructions:

The motor ratings or nominal motor currents specified or recommended on the datasheets for the use of a braking device refer to normal applications with drives having a moment of inertia that approximately equals the moment of inertia of the motor.
In all other cases, the required braking torque or braking current need to be determined more precisely (see below).

Without taking into account any possible braking torques of the load, the required braking current (direct current) can be estimated according to the following formula:

$$I_B = f_B \times \sqrt{\frac{t_A}{t_B}} \times I_N$$

I_B Braking current in A
 f_B Braking factor acc. to the table specified below
 t_B Braking time required in s
 I_N Nominal/rated motor current in A
 t_A Time until nominal speed is reached (in the case of motors with star-delta start – approx. switch-over time)

Values usual for t_A :

Conveyor belt - 20s	Pump	- 8s	Power crusher	- 30s
Compressor - 10s	Fan	- 20s	Circular saw	- 10s

Connection of motor winding at nominal operation		during braking

The two following examples are to explain the calculation:

Example 1

Assumption: Motor shaft power: 2.2kW (230V/400V)
Nominal motor current (2-pole motor): 8.5A/4.9A
Ramp-up time (circular saw): 6s (direct start)
Braking frequency: 1/h

The application of the circular saw requires that, after switching the saw off, the saw disk must come to a standstill within 5s.
From this, there results a maximum braking time of 5s which we use in the calculation formula, too:

$$16.1A = 3 \times \sqrt{\frac{6s}{5s}} \times 4.9A$$

In the case of this application with direct start, the motor windings are in nominal operation star-connected. Braking too is effected in star-connection, which results in a braking current of approx. 16A ($f_B = 3$), i.e., for this circular saw, a braking device with a nominal/rated current of at least 20A, such as a **VB 400-25L** or **VB 400-25** (with a max. braking current of 25A each), has to be used.

Example 2

Assumption: Motor shaft power: 30kW (400V/690V)
Nominal motor current (2-pole motor): 56A/32.5A
Ramp-up time (circular saw): 12s (star-delta start)
Braking frequency: 2/h

In this example, the motor is to be braked within 5s. In the first case, braking is effected with the motor windings being star-connected and, in the second case, delta-connected.

case 1 ($f_B = 1.7$):

$$147A = 1.7 \times \sqrt{\frac{12s}{5s}} \times 56A$$

case 2 ($f_B = 2.6$):

$$225A = 2.6 \times \sqrt{\frac{12s}{5s}} \times 56A$$

This example shows that, if braking is effected in delta-connection, a larger braking current and therefore a larger braking device is required than in cases in which braking is effected with the motor windings being star-connected.

In case 1, a braking with 200A could be used, and in case 2, a 400A device would have to be used. For case 1, it is sensible to use a braking device featuring the star-delta contactor control option (option „APC“) by means of which the motor windings are automatically star-connected during the braking operation. Besides, it is thus possible to save the costs otherwise required for the star-delta contactor combination.

The device to be recommended for case 1 would then be a braking device of the **VB 400-200 APC** type.

If you have detailed data on the drive available, such as the moment of inertia of the load and of the motor as well as the starting torque, you can determine the braking current more precisely:

$$I_B = 0.31 \times k \times I_A \sqrt{\frac{n_N \times J}{t_B \times M_A}}$$

I_A	Starting current in star or in delta/1.72 in A
$k = 1$	Braking in star-connection
$k = 1.15$	Braking in delta connection
t_B	Braking time required (in s)
n_N	Nominal speed (in 1/min)
J	Moment of inertia of the drive (motor with load) in kgm^2
M_A	Starting torque (in Nm)

Example 3

Assumption:	Motor shaft power:	15kW (400V/690V)
	Nominal Motor current (2-pole motor):	29.5A/17A
	Starting current:	140A
	Starting torque:	75Nm
	Moment of inertia of motor:	0.1 kgm^2
	Circular saw disk	Diameter 800mm Thickness 5mm

For the saw disk, there results the mass „m“ of approx. 20kg; based on this mass, the moment of inertia of the saw disk is 1.6 kgm^2 . Consequently, the following values can be used for calculating the braking current:

$$123A = 0.31 \times 1 \times 140A \sqrt{\frac{2850 \text{ 1/min} \times (0.1 + 1.6)\text{kgm}^2}{8s \times 75\text{Nm}}}$$

Based on a guesstimate regarding the application of the braking device, we would have offered a 100A braking device for a 15kW-motor

This example shows that if large centrifugal masses are to be braked, it is quite useful to do a precise calculation. Such a large mass, in combination with a high speed, requires a larger braking current than normally needed, which is proved by the calculation. In this case too, it would be sensible to use the above mentioned brake **VB 400-200 APC**.

From this equation, the influence of the speed and the moment of inertia of the drive to be braked becomes obvious.

The braking current determined according to one of the above descriptions should be less than or equal to the nominal/rated current of the braking device. If in these dimensional calculations, a braking current which equals 100% of the nominal device current is used, please make sure that in the case of devices up to 36A the max. braking time is 20s, and for devices from 40A up the max. braking time is 40s. If braking times > 20s (devices up to 36A) or > 40s (devices from 40A up) are to be expected, it must be taken into account when selecting a braking device that the permissible max. braking current is to be accordingly reduced.

For more detailed information please see the device-specific commissioning instructions.

A very important aspect in the dimensional calculation of brakes is to take into account the cyclic duration factor (c.d.f.) indicated on the data sheets. Under no circumstances the c.d.f. be exceeded (the worst case is to be taken into account !!).

How to calculate the cyclic duration factor (c.d.f.):

$$\text{c. d. f.} = \frac{t_B}{t_Z} \times 100 \quad \begin{matrix} t_B \\ t_Z \end{matrix} \quad \begin{matrix} \text{Braking time} \\ \text{Cycle time (running - braking)} \end{matrix}$$

If the required cyclic duration factor (c.d.f.) exceeds the permissible values indicated on the data sheet, the permissible maximum braking current is to be accordingly reduced.

The data required in this connection can be found in the device-specific commissioning instructions.

If it is not possible to reduce the braking current, a braking device with a higher braking current has to be used.

Example:

If the required c.d.f. is twice as high as the value indicated on the data sheet, a braking device of twice the nominal/rated device current has to be used.

Dimensioning of braking contactors:

The braking contactor is switched on or off via a control contact of the braking device (no-load switching).

When selecting the braking contactor, it must be ensured that the contacts are able to carry the maximally occurring braking current (nominal/rated device current). Therefore, the value “conventional thermal current” (I_{th}) is decisive when selecting the braking contactor. If this value is not indicated, the rated operational current for AC1-operation may be used instead.

Tip: By connecting contacts in parallel it is often possible to use a lower-priced contactor of a smaller design.

Dimensioning of pre-fuses:

Basically, two types of fuse are available for the user:

1. Fusing according to allocation type „1“ DIN EN 60947-4-2.
After a short circuit, the braking device is allowed to be inoperative.
2. Fusing according to allocation type „2“ DIN EN 60947-4-2.
After a short circuit, the braking device must be suitable for further use. However, there is the danger that the contacts of the braking relay (braking contactor) weld. Therefore, if possible, these contacts are to be checked prior to reconnecting the device to the supply. If this check cannot be carried out by the user, the device has to be returned to the producer in order to have it checked.

The following dimensioning information refers to the below operating conditions:

- Use of standard asynchronous motors
- Braking time not exceeding 20s, for braking devices up to 36A
- Braking time not exceeding 40s, for braking devices from 40A up
- Braking current not exceeding $2.5 \times I_{NOM}$ of the motor
- Cyclic duration factor (c.d.f.) not exceeding the value indicated on the data sheet

Fusing according to allocation type „1“:

As pre-fuses, we recommend to use line protection fuses (utilization category gL) or automatic circuit-breakers with tripping characteristic B, C, D or K.

Taking into account the maximum braking currents that occur (normally the nominal/rated device current), we recommend fuses according to table 2, column 3.

Note! Wiring cross-sectional area according to DIN VDE 0100-430, DIN EN 57100-430.

Fusing according to allocation type „2“:

The power semiconductors are to be protected by fuses of the utilization category gR (semiconductors fuses, high-speed fuses).

However, since these fuses do not ensure line protection, it is necessary to use additionally line protection fuses (utilize. Category gL).

As for the dimensioning of the line protection fuse (gL), please refer to table 2, column 3.

To protect the semiconductors it is necessary to select gR-fuses featuring cutoff I^2t -values of the ranges indicated in table 2, column 4.

In this connection, the current value of the selected fuse should not be smaller than the braking current to be expected (nominal/rated device current).

Notes

- On the basis of the recommended I^2t -value, braking current, and possibly the c.d.f., the fuse supplier is able to select a suitable type. Due to the great variety of producers, sizes and types, PETER electronic does not recommend any particular fuses.
- If the value of the fuse or cutoff- I^2t is selected too small, it may happen that the semiconductor fuse reacts during braking

Table 2

max. braking current / nominal/rated device current	device type	fuse value, allocation type „1“	recommended range fo cutoff- I^2t -value of semiconductor protection fuses, allocation type „2“

Features:

- ☒ small design
- ☒ easy programming and connection
- ☒ precise and reliable control for IE2, IE3 & IE4 motors
- ☒ induction motors, PM motors,
brushless DC motors, synchronous reluctance motors
- ☒ 14 parameters for basic settings
- ☒ precise digital control via push of a button
- ☒ application macros (industrial-, pumps- and fan operation)
- ☒ PTC input
- ☒ max. rotating field frequency 500Hz
- ☒ integrated braking chopper (up from 2,2kW)
- ☒ degree of protection IP20
- ☒ integrated mains filter
- ☒ serial communication with Modbus RTU and CANopen

AC drive
VD i 037 ... 220/E3
VD i 075 ... 2200/3E3

Function:

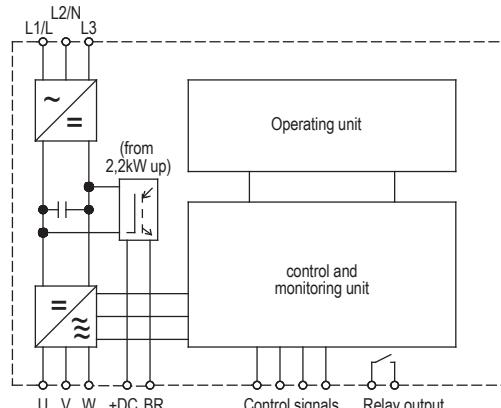

- ☒ control and setpoint entry via terminals, operating unit and Bus-systems
- ☒ PWM clock frequency 4 - 32kHz
- ☒ DC braking
- ☒ potential-free control and signalling contacts
- ☒ 150% overload for 60s
- ☒ detailed trouble check via parameter „o“
- ☒ integrated PI controller
- ☒ U/f characteristics control
- ☒ Open Loop vector speed control
- ☒ Open Loop speed control for synchronous motors
- ☒ BLDC vector control
- ☒ synchronous reluctance motor

Typical Application:

- | | |
|-------------------|-----------------------|
| pumps | wood working machines |
| grinding machines | conveying systems |
| ventilators | printing machinery |
| textile machines | packaging machines |

Options: (please see accessories)

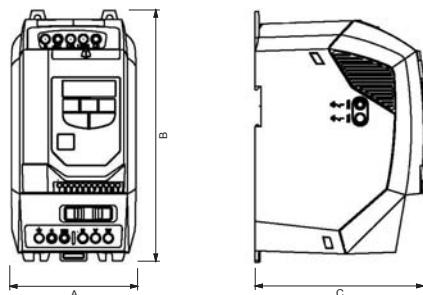

- ☒ memory stick with copying function
- ☒ remote control module (LED or OLED display)
- ☒ RJ45 cable and cable splitter
- ☒ braking resistors
- ☒ software for parameterization

- ☒ degree of protection IP66
- ☒ integrated mains filter
- ☒ integrated Modbus RTU module and CANbus

AC drive
VD i 075 ... 220/Pro/IP66
VD i 075 ... 750/3Pro/IP66

Function:

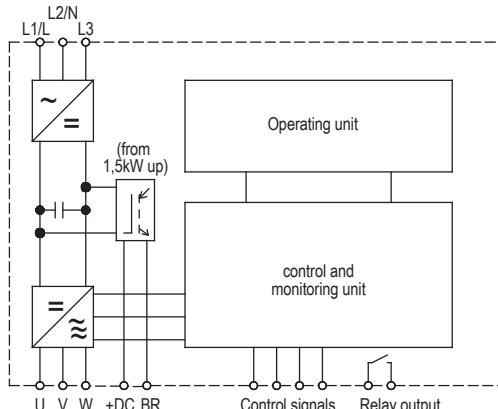

- ☒ control and setpoint entry via terminals, operating units and bus systems
- ☒ PWM clock frequency 4 - 32kHz
- ☒ sensorless speed and torque control
- ☒ potential-free control and signalling contacts
- ☒ 150% overload for 6s
- ☒ integrated PI controller
- ☒ detailed trouble check via parameter Po-13
- ☒ PLC function

Typical Application:

- | | |
|-------------------|----------------------|
| pumps | woodworking machines |
| grinding machines | conveying systems |
| ventilators | printing machinery |
| textile machines | packaging machines |

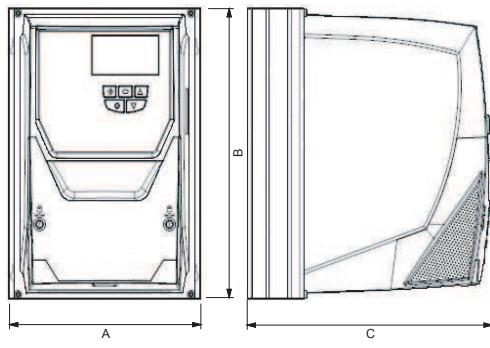

Options: (please see accessories)

- ☒ remote control module
- ☒ input and output module
- ☒ RJ45-cable and cable splitter
- ☒ encoder extension module
- ☒ communication- and bus-plug-ins
- ☒ bluetooth-memory stick
- ☒ braking resistors
- ☒ software for parameterization and operating
- ☒ license key for PLC
- ☒ available with switch

Accessories AC drive Braking Resistor

4.25

Features:

- ☒ short-circuit-proof, „intrinsically safe“ resistor, especially for our inverters (with built-in braking transistor)
- ☒ anodized aluminium housing
- ☒ the inverter software protects the braking resistor against overload, thus making additional overload relays unnecessary
- ☒ degree of protection IP65

Braking Resistor
BWD

Typical Applications:

Our braking resistors have been especially developed for use in inverter applications involving high moments of inertia that need to be brought to a standstill rapidly and in a controlled way. A dynamic braking resistor supports our inverters by converting excess energy from the motor into heat. For the braking resistor appropriate for your inverter, please see the tables below.

recommended for drive rating / kW	0,75	1,5	2,2	2,2

*dimensions upon request

Up from 55kW upon request.

Should you need any further technical information on braking resistors, please simply get in touch with us.

4.26

Features:

- ☒ slim, compact design
- ☒ single-/threephase mains filter
- ☒ extremely high insertion loss, from 150kHz to 30MHz
- ☒ suitable for all PETER electronic inverters
- ☒ degree of protection IP20

**Mains Filter
NF 240/380**

Function:

A mains filter keeps interferences generated by the inverter away from the mains, thus ensuring that applicable standards are complied with.

Class A limits in accordance with EN 55011 are complied with up to a maximum cable length of 50m.

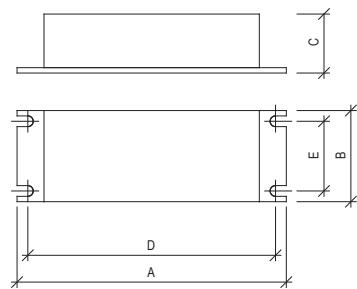

For the mains filter suitable for your inverter, please refer to the tables below.

Typical Application:

All dimensions indicated in mm

Connection Diagram:

Features:

- ☒ 3-phase dv/dt filter
- ☒ insulation class T40N <182A; T40F >230A
- ☒ typical dv/dt reduction > factor 5
- ☒ impedance U_k 0,8%
- ☒ vertically mounted on angle bracket
- ☒ suitable for use for all PETER electronic inverters
- ☒ degree of protection IP00

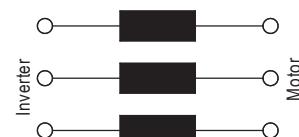

**Motor Reactor
RWK 305**

Function:

To ensure a long service-life of motors, it may become necessary to reduce the steep voltage edges (dv/dt) on the output of the frequency inverter by means of a motor reactor. At the same time, motor reactors also eliminate excessive overvoltage and interference current caused by parasitic line capacitance. If this type of filtering is insufficient or if you require a sinusoidal voltage on the output of the frequency inverter, a sine filter is to be used. In this case, please consult the factory.

Typical Application:

AC drive

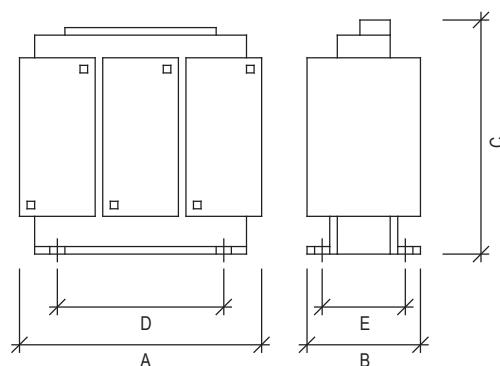

For the dv/dt filter suitable for your VersiDrive i, please see the tables below.

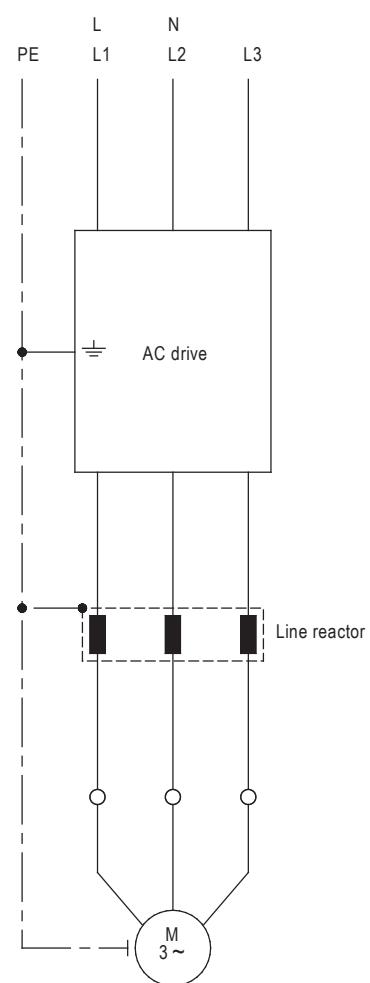

Type designation	Motor Reactor RWK 305...						
	4	10	14	17	24	32	45
for motor shaft power / kW	1,5	-4	5,5	7,5	11	15	-22

Thyristor Controllers SGP 160 – 2,5 ... 16

5.01

Features:

- ☒ for motors with external and permanent excitation
- ☒ one-quadrant operation
- ☒ control range with armature voltage control 1:30
- ☒ control range with tachometer control 1:100
- ☒ degree of protection IP 00

Thyristor Controllers
SGP 160 – 2,5 ... 16

Function:

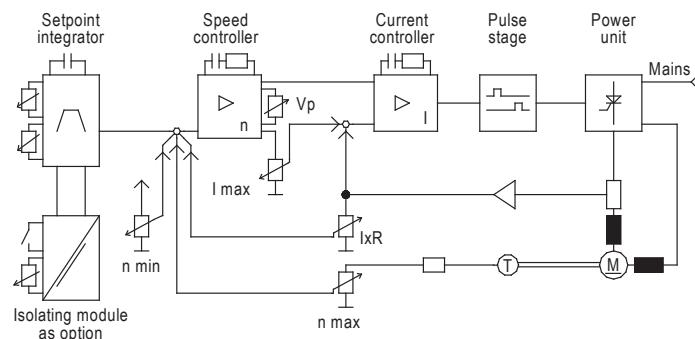

- ☒ half-controlled symmetrical bridge circuit with excitation voltage source
- ☒ adjustable current controller and thus very suitable for permanently excited motors

Typical Applications:

- conveying systems
- printing machines
- pumps
- rotary table drives
- welding wire feed mechanisms
- packaging machinery

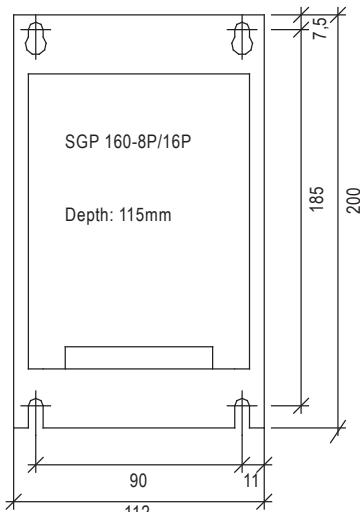

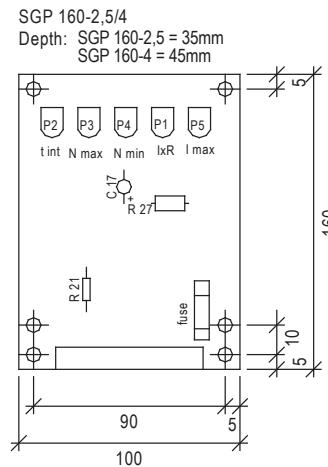

Options:

- ☒ with isolating module (P)
- ☒ pluggable with pin connector DIN 41617 (ST)
- ☒ pluggable with isolating module (ST/P)

General Accessories

	order number
potentiometer in VDE-design 10kΩ	41750.01103
socket connector DIN 41617 / 31pole	53231.00003

Features:

- ☒ no external initiators necessary
- ☒ independent of direction
- ☒ broken wire detection
- ☒ positive guided safety contacts: 3 NO contacts, 1 NC contact for AC 250V
- ☒ adjustable voltage setting
- ☒ adjustable standstill time delay
- ☒ LED indicators for standstill, event of line breakage and operating voltage
- ☒ Suitable for operating with inverters
- ☒ width 45mm
- ☒ nominal motor voltage up to 690V

Safety Standstill Monitor
VersiSafe

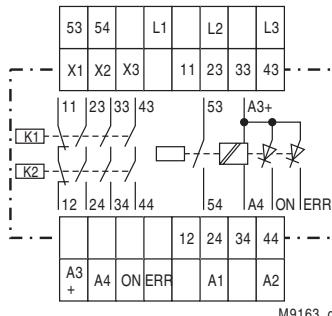

Function:

- ☒ safe standstill detection on three- and single-phase motors
- ☒ detection of standstill via monitoring of remanence voltage
- ☒ redundant measurement via two independent channels
- ☒ adaptable to various motor types and applications

Safety rated data:

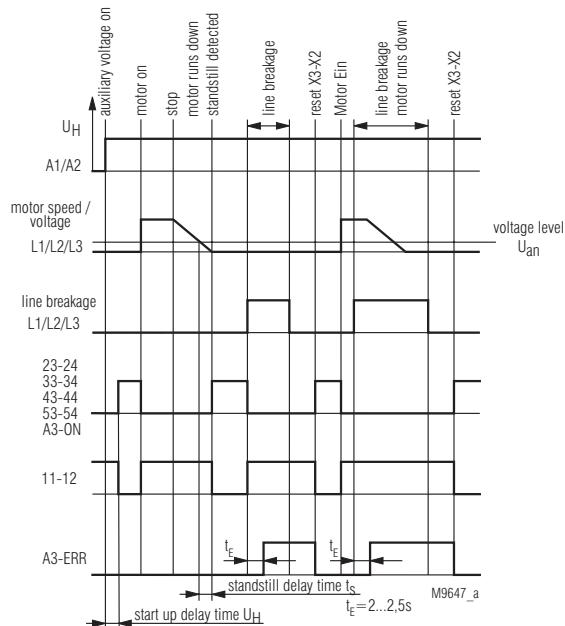

- ☒ values according to EN ISO 13849-1:
safety category: 4
performance level: e
 $MTTF_d : 93\text{a}$
 $DC_{avg} : 99,0\%$
 $d_{op} : 365 \text{ days/year}$
 $h_{op} : 24 \text{ hours/day}$
 $t_{zyklus} : 28,8E+03 \text{ s/zyklus} = 1 / 8 \text{ hours}$
- ☒ values according to IEC EN 62061 / IEC EN 61508:
SIL CL: 3 IEC EN 62061
SIL 3 IEC EN 61508
HFT: 1 (Hardware-Failure-Tolerance)
 $DC_{avg} : 99,0\%$
SFF 99,7%
 $PFH_D : 4,10E-10 \text{ h}^{-1}$

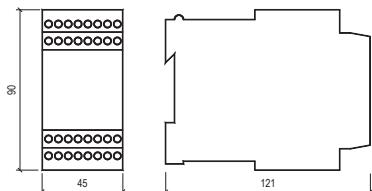

Typical applications:

Safe standstill detection in:

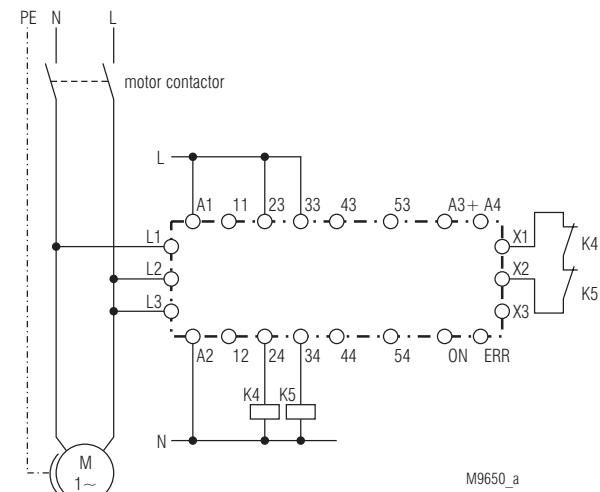

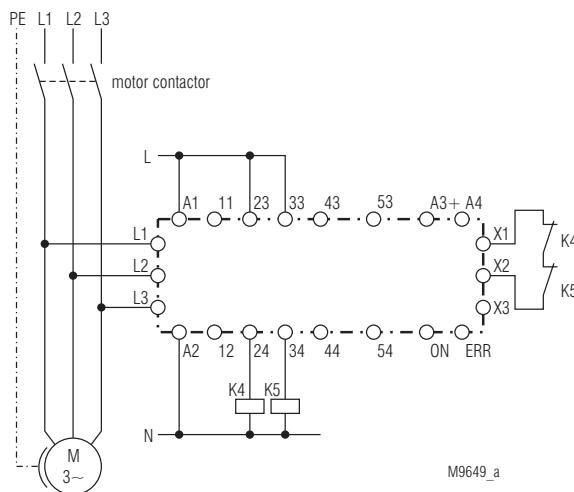

- safety circuits according to IEC/EN 60204 in machines with dangerous parts or tools (e.g. to enable gate interlocks on machine tools or to activate hold in brakes)
- to avoid damage if unexpected start can cause collision
- motor control when reversing direction

Typical designation	VersiSafe
input L ₁ , L ₂ , L ₃ measuring-/motor voltage	max. 690 V
safety output (3 NO contacts/1 NC contact)	AC 250V, 5A
indicator contact	AC 250V, 3A
auxiliary voltage U _H	DC 24V
response value U _{an}	AC 230V
standstill time	AC 400V
max. operating frequency	20...400mV (special unit 0,2 ... 4V)
ambient/storage temperature	0,2...6s
weight / kg	1200/h
order number	-25°C...+60°C / -40°C...+75°C
special unit/response value U _{an} 0,2 ... 4V	0,4
order number	27801.69000
	27800.69000
	27802.69000
	27803.69000
	27805.69000

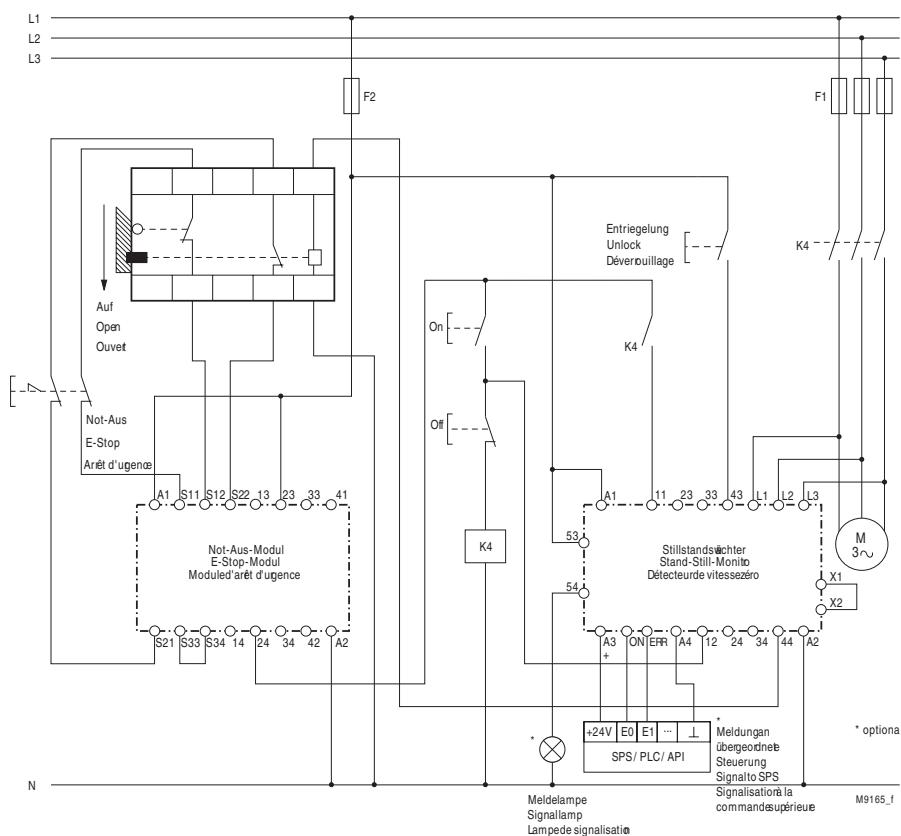

Dimensions:

All dimensions indicated in mm

Connection Diagrams:

with three-phase motor

with single-phase motor

typical combined connection with emergency stop

Subject to change without notice.

Features:

- ☒ safe, sensorless drive monitoring
- ☒ over-, underfrequency or window monitoring of single-phase or 3-phase AC systems
- ☒ user friendly frontside display
 - comfortable, menu guided configuration
 - for set point and actual value of Hz
- ☒ manual or auto-reset
- ☒ simple and time-saving setup without PC
- ☒ extensive diagnostic functions
- ☒ possibility of overriding the speed by a supervisory function (muting)
- ☒ up to 4 activatable operating modes (e.g. automatic-, installation- or service operation)
- ☒ galvanic separation between measuring input, auxiliary voltage and output contacts
- ☒ 2-channel function
- ☒ forcibly guided output contacts
- ☒ LED-indicators and 2 semiconductor monitoring output
- ☒ analog output
- ☒ up to 4 frequency modes selectable
- ☒ width 45 mm

Safety Frequency Monitor
VersiSafe Speed

Function:

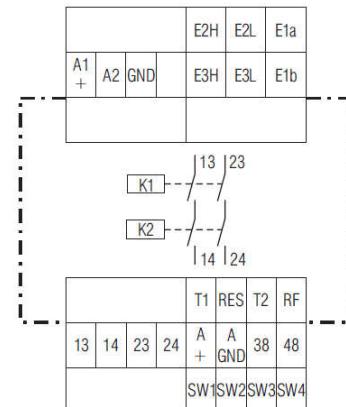

- ☒ fast reaction time by measuring duration of cycle of input frequency
- ☒ adjustable hysteresis
- ☒ adjustable reset delay function from 0 ... 100 s
- ☒ adjustable start up time delay from 0 ... 100 s
- ☒ adjustable alarm delay from 0,1 ... 100 s

Typical Applications:

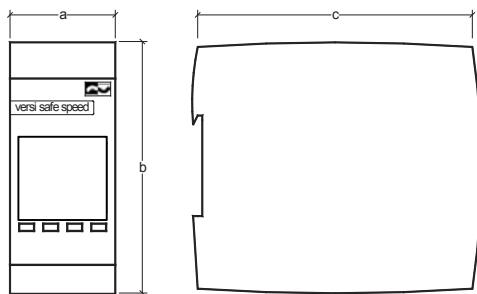

monitoring of output frequency of inverters
 platform technics
 wood working machinery
 machine tools
 wind generator machines
 crane applications

Safety rated data:

- ☒ safety category 4 / Performance Level (PL) e to DIN EN ISO 13849-1
- ☒ SIL-Claimed Level (CL) 3 to EN 62061 and EN 61800-5-2
- ☒ SIL 3 to IEC 61508 and EN 61511
- ☒ safety functions according to EN 61800-5-2
 - STO (Safe Torque Off),
 - SOS (Safe Operating Stop),
 - SLS (Safely Limited Speed),
 - SSM (Safe Speed Monitor)
 - SSR (Safe Speed Range)

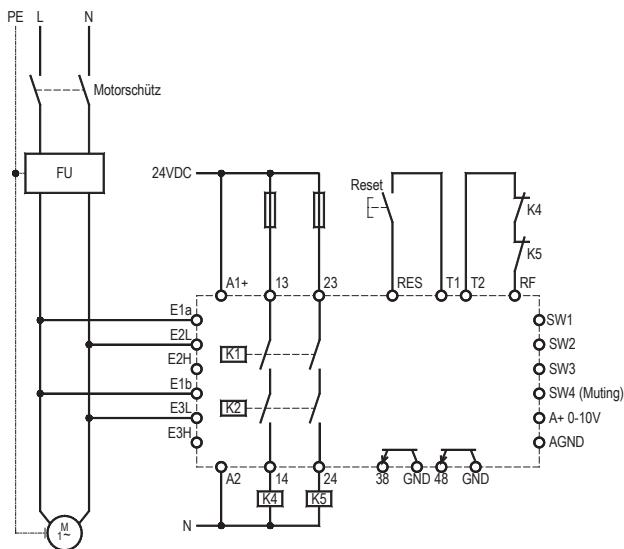

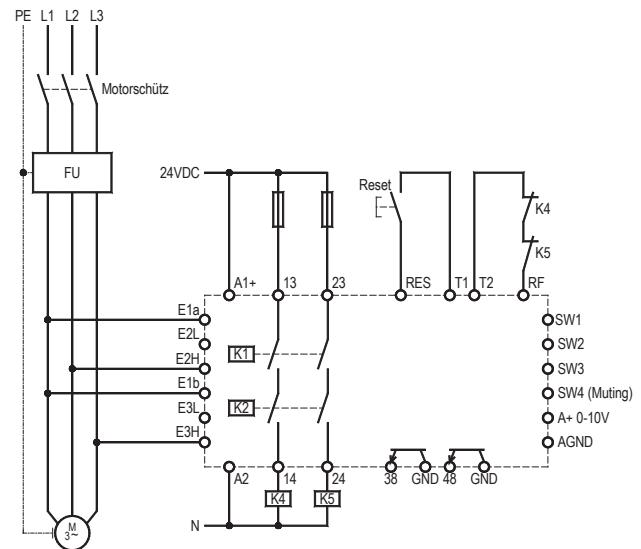

Typical designation	VersiSafe Speed
voltage range	AC 8 ... 280 V
E1a-E2L, E1b-E3L	AC 16 ... 600 V
E1a-E2H, E1b-E3H	24 VDC, typ. 3,2W
auxiliary voltage U _H	<700Hz
input frequency	adjustable from 1 Hz ... 600 Hz
response value (frequency threshold)	> 1 kHz
pulse frequency inverter	< ± 2 %
measuring accuracy	duration of 1 cycle (inverse value of adjusted frequency) + 10 ms + adjusted response delay
reaction time of frequency monitoring	2 NO contacts forcibly guide, Semiconductor monitoring output
contacts	housing IP40, terminals IP20 -25°C...+60°C / -40°C...+75°C
